SCIENTIFIC RATIONALE

In the last decades, survival rates of Multiple Myeloma have been brilliantly improved thanks to the introduction of novel agents: patients diagnosed after 2010 have had higher rates of novel therapy use and better survival outcomes compared with those of earlier years. Most relevant therapeutic advances over the past decades has been the introduction of novel therapies, such as immune modifying agents (thalidomide and lenalidomide) and proteasome inhibitors (bortezomib), adopted with or without stem cell transplantation. Moreover, in the last few years, the MM therapeutic “toolbox” has improved further with the approval in new generation IMiD (pomalidomide), the monoclonal antibodies, daratumumab and elotuzumab, as well as the new-generation proteasome inhibitors,

carfilzomib and ixazomib, waiting for introduction in daily practice of novel agents with new mechanism of action (Belantamab, CAR-T). At the same time, there is increasing understanding of MM tumor biology, creating the rationale for new combinations of drugs and new therapy development. Discovery of the associated cytogenetic abnormalities confirm the hypothesis that MM is a heterogeneous disease, suggesting that riskadapted therapies and individualizing treatment will further help improve patient management. The aim of this event is the discussion between international and national experts.
